Vista Leads in Energy Efficiency with Largest Selection of LED Fixtures

Backed by a growing movement to “go green” and improve energy-efficiency, LED is transforming the landscape lighting market.

With Vista’s intimate understanding of the needs of the professional user, we have perfected a comprehensive range of LED luminaires that are rugged, easy-to-install and flexible in design.

LED fixtures from Vista provide excellent light output, low power consumption, low heat generation and durability unmatched by any other lighting product.

The advantages of Vista LED products are unbeatable:

- **Reduced energy consumption of up to 80% versus traditional lamps.** Dramatically lowers power bills, reduces transformer size up to 80%.
- **Simplified installation.** More fixtures per cable reduces complexity of installations and wire costs. Reduces complex voltage drop calculations.
- **Long life.** Reduces maintenance requirements, ideal for fixtures in hard-to-reach areas. “Fit and forget”. Up to 10 year life in typical field conditions.
- **Safety.** LED generates little heat, so fixture lenses stay cool to the touch, providing an extra margin of safety in both low-voltage and line-voltage applications.
- **Meet green building requirements.** Recommended as a proven method to reduce energy use, Vista fixtures help you achieve green building goals.

Among the first to introduce this technology to landscape market, Vista’s LED product offering has expanded over the last 5 years to encompass a full selection of fixtures including pathlights, accent lights, in-ground and step/brick fixtures.

Look for the LED Available Logo in Your Vista Catalog. It designates fixtures available with Vista’s robust LED system.
