## Test Methods

## Photometric Measurements - Goniophotometer

A Custom Light Laboratory Type C Rotating Mirror Goniophotometer was used to measure candelas(intensity) at each angle of distribution as defined by IESNA for the appropriate fixture type.

Ambient temperature is set to $25^{\circ} \mathrm{C}$ and is measured from the center of the fixture, within 1 ft from the outside of the fixture. Temperature is maintained at $25^{\circ} \mathrm{C}$ throughout the testing process and the sample is stabilized for at least 30 mins and longer as necessary for the sample to achieve stabilization.

Electrical measurements are measured using the listed equipment.

## Spectral Measurements - Integrating Sphere

A Sensing Spectroradiometer SPR-3000, in conjunction with Light Laboratory 2 meter integrating sphere was used to measure chromaticity coordinates, correlated color temperature(CCT) and the color rendering index(CRI) for each sample.

Ambient temperature is set to $25^{\circ} \mathrm{C}$ and is measured from the center of the fixture, within 1 ft from the outside of the fixture. Temperature is maintained at $25^{\circ} \mathrm{C}$ throughout the testing process and the sample is stabilized for at least 30 mins and longer as necessary for the sample to achieve stabilization.

Electrical measurements are measured using the listed equipment.
